IT IS A POLYPEPTI FROM MAPIB BY PROTECTIVITIC PROCESSING. IT IS FREE TO FROM MAPIB BY PROTECTIVITIC PROCESSING.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cell Biol. 109:3367-3376(1989).

FUNCTION: THE FUNCTION OF BARAIN MAPS IS ESSENTIALLY UNKNOWN.

PHOSPHORYLATED MAPIB MAY PLAY A ROLE IN THE CYTOSKELETAL CHANGES

THAT ACCOMPANY NEURITE EXTENSION. POSSIBLY MAPIB BINDS TO AT LEAST

TWO TUBULIN SUBUNITS IN THE POLYMER, AND THIS BRIDGING OF SUBUNITS

MIGHT BE INVOLVED IN NUCLEATING MICROTUBULE POLYMERIZATION AND IN

STABILIZING MICROTUBULES

SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE

SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE

SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE

Ferredoxin--NADP reductase, leaf isozyme, chloroplast precursor [Precurs of 1.18.1.2) (FNR).
                                                                                                                                             "A productive NADP+ binding mode of ferredoxin-NADP revealed by protein engineering and crystallographic Nat. Struct. Biol. 6:847-863 (1999).

-I- FUNCTION: MAY PLAY A KEY ROLE IN REGULATING THE OF CYCLIC AND NOW-CYCLIC ELECTRON FLOW TO MEET TO PLANT FOR ATP AND REDUCING POWER.

-I- CATALYTIC ACTIVITY: Reduced ferredoxin + NADP(+) ferredoxin + NADPH.
                                                                                                                                                                                                                                               X-RAY CRYSTALLOGRAPHY (1.70 ANGSTROMS).

Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
C.:- FUNCTION: Structural component of the muscle M-line. Myofilament assembly begins with postitional cues laid down in the lattice assembly begins with postitional cues laid down in the basement membrane and muscle cell membrane. UNC-89 responds to these signals, localizes, and then participates in assembling an M-line.
C.:- TISSUE SPECIFICITY: Localizes to the middle of A-bands.
C.:- SIMILARITY: Contains 1 BBL-homology (DH) domain.
C.:- SIMILARITY: Contains 49 immunoglobulin-like C2-type domains.
C.:- SIMILARITY: Contains 1 PH domain.
C.:- SIMILARITY: Contains 1 SR3 domains.
C.:- SIMILARITY: Contains 1 SR3 domains.

MECATIVE REGILATOR OF THE PHEROMONE-RESPONSE PATHWAY THROUGH THE STEED PROTEIN KINASE, ACTS AT A STEP BETWEEN THE GPROTEIN AND THE MAP KINASE MODULE. DOMINANT SUPPRESSOR OF BUD EMBREGENCE DEFECT CAUSED BY DELETION OF IPL2/BEM2. INVOLVED IN THE CONTROL OF POLARIZED CELL GROWTH AND PROPERS BUD SITE SELECTION.

COLUMN STEP SELECTION.

C. -: SIMILARITY: Contains 1 Rho-GAP domain.
                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. "Differential regulation of microtubule-associated protein 1B (MAP1B)
in rat CNS and PNS during development.";

J. Neurosci. Res. 49:319-32(1997)

-!- FUNCTION: The function of brain MAPS is essentially unknown.

Phosphorylated MAP1B may play a role in the cytoskeletal changes that accompany neurite extension. Possibly MAP1B Binds to at least two tubulin subunits in the polymer, and this bridging of subunits might be involved in nucleating microtubule polymerization and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         stabilizing microtubules.
SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate with MAP1A and MAP1B proteins.

                                                               nerve levels are high early in development but decrease during postnaral development and are low in adults. In dorsal root ganglia levels remain high throughout development.

INDUCTION: By nerve growth factor.

INDUCTION: By nerve growth factor is region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

WHY. LCI is coexpressed with MAPIB. It is a polypeptide generated from WAPIB by proteolytic processing. It is free to associate with both MAPIB and MAPIB. It interacts with the amino-terminal region
TISSUE SPECIFICITY: Nervous system (spinal cord, brain stem, cerebellum and cerebrum). Not expressed in liver, spleen, kidney,
                                                                                                                                                                                                                                                                               CAUTION: A C-terminal fragment of this protein (residues 1597 to 2459) was originally described as neuraxin in Ref.3.
                                               DEVELOPMENTAL STAGE: In cerebral cortex, spinal cord and sciatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (HIGHLY BASIC, CONTAINS MANY

Michalowski C.B., Schmitt J.M., Bohnert H.J.;

Michalowski C.B., Schmitt J.M., Bohnert H.J.;

Expression during salt stress and nucleotide sequence of cDNA for ferredoxin-NADP+ reductase from Mesembryanthemum crystallinum.";

Plant Physiol. 18:817-822(1989).

-!- FUNCTION: MAY PLAY A KEY ROLE IN REGULATING THE RELATIVE AMOUNTS

OF CYCLIC AND NON-CYCLIC ELECTRON FLOW TO MEST THE DEMANDS OF THE PLANT FOR ATP AND REDUCING POWER.

-!- CATALYTIC ACTIVITY: Reduced ferredoxin + NADP(+) = oxidized ferredoxin + NADPH.
                                                                                                                                                                                                                                                                                                                                                                                                                                              -!- COFACTOR: FAD.
-!- COFACTOR: FAD.
-!- PATHWAY: FINAL STEP IN LINEAR PHOTOSYNTHETIC ELECTRON TRANSPORT
CHAIN; IT HAS ALSO BEEN IMPLICATED IN CYCLIC ELECTRON FLOW AROUND
PHOTOSYSTEM I, ITS ROLE BEING TO RETURN ELECTRONS FROM FERREDOXIN
TO THE CYTOCHROME B-F COMPLEX.
-!- SUBGELLULAR LOCATION: CHLOROPELAST; STROMAL SIDE OF THE THYLAKOID
AND FRINGE PORTION OF THE MEMBRANE.
-!- SIMILARITY: WITH OTHER SPECIES FUR.
                                                                                             Ferredoxin--NADP reductase, chloroplast precursor (EC 1.18.1.2) (FNR)
                                                                                                                                                    Bukaryota, Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;
Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots;
Caryophyllidae; Caryophyllales; Aizoaceae; Mesembryanthemum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NADP (RIBOSE PART) (BY SIMILARITY)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             40;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9.5%; Score 85; DB 1; Length 365;
